

VENOUS ACCESS

Interventional Radiologists are working hard to keep you in shape.

A Central Venous Access Catheter (CVAC) prevents the discomfort of repeated needle injections to patients with serious diseases such as cancer and kidney failure.

Using their skill in imaging, Interventional Radiologists place a tube under the patient's skin. This allows healthcare providers a pain free method of administering medication, nutrients, as well as drawing patient's blood.

This is one of the many ways Interventional Radiologists are improving the quality of life for patients with life-threatening conditions.
